

ABSTRACT OF THE DISCLOSURE

The present invention provides a system and method for providing object to object communication. In architecture, the system includes an identifier that identifies at least two objects from a plurality of objects to communicate, and a locator that locates the at least two objects to communicate. A component framework then enables the communication of the at least two objects. The present invention can also be viewed as a method for providing object to object communication. The method operates by identifying at least two objects from a plurality of objects to communicate, and locating the at least two objects to communicate. A component framework is used to enable the communication of the at least two objects.
